

Mold hygrometer

Control ventilation and prevent mold - easily with the hygrometer

Mold warning and humidity indicator

Excessive humidity in homes not only caused millions in damages, but also unhealthy. In addition, the damage looks ugly. The common opinion, the moisture coming from the outside, is wrong in most cases. In reality, the humidity in the house (evaporation, kitchen, bathroom) arises. Therefore, the control of the indoor climate is important for healthy living. The hygrometer indicates mold to dry or damp indoor air - through efficient ventilation or heating so you can create the right living environment and avoid mold.

Rule of thumb for reducing the risk of mold

Rule 1

Living areas 3-5 times daily for about 5 minutes Shock = ventilation simultaneous airing of several rooms for an effective air exchange in the home.

Rule 2

Ventilation through windows in tilt leads to unnecessary heat energy losses! Lintels cool in winter from strong, which promotes unwanted condensation in this area.

Rule 3

Make larger pieces of furniture not to cold outside walls. If this is not possible then to allow a distance of 5-10 cm from the walls, an air circulation.

Rule 4

Keep doors closed in rooms with high humidity or development with particularly low temperature. Ventilate these rooms with the doors closed until the room humidity has dissipated.

Rule 5

In a basement can cause mold problems in contrast to above-ground parts of the building in the summer when warm, moist outside air condensing on the cold walls. In summer basements must therefore be aired very deliberate.

Application

Place the mold in the home hygrometer. Once the rel. Humidity rises above 65%, a warning beep. By now, you should ventilate and do it properly! See rule left.
